ABSTRACT

Modified proteins are disclosed that maintain enzymatic and insecticidal activity
while displaying reduced or eliminated allergenicity. Epitopes which bind to anti-patatir
antibodies were identified, and removed via site directed mutagenesis. Tyrosines were
observed to generally contribute to the allergenic properties of patatin proteins. Remova
of glycosylation sites was observed to reduce or eliminate antibody binding.

Permuteins are also disclosed which have a rearranged amino acid sequence while retaining enzymatic activity.

Deallergenized proteins and permuteins can be used as insecticidal materials, as nutritional supplements, and as immunotherapeutic agents.
